

Wanderi Travel – Travel Booking Mobile App

Design Explanation

Name: Sania Rasheed

Task 4: Mini Project – Prototype Design

- **Introduction:** The objective of this project was to design and develop a modern, interactive, and user-friendly travel booking mobile application prototype using Figma. The prototype was created to provide users with a complete digital travel booking experience, including flight booking, hotel reservation, seat selection, payment processing, and booking management.
The application aims to simplify the travel planning process by offering a clean interface, easy navigation, and an organized booking flow. The project mainly focused on improving user experience through intuitive design elements and interactive navigation.
This prototype was designed as part of the UI/UX Design Task assigned by CodeAlpha, demonstrating the practical implementation of mobile application design principles and interactive prototyping techniques.
- **Design Approach:** The design approach for this project was based on the principles of simplicity, consistency, accessibility, and user-centered design. The interface was designed using a minimal and modern visual style to ensure a professional appearance and smooth usability.
The application avoids unnecessary complexity and keeps users focused on the booking process. Card-based layouts, proper spacing, rounded UI components, and simple navigation patterns were used to create a visually balanced and easy-to-use interface.
- **Color Scheme:** A soft green and dark neutral color palette was selected to represent travel, nature, comfort, and trust. These colors create a calm and visually appealing environment while maintaining readability across all screens. The selected color palette also maintains sufficient contrast for readability and accessibility across different mobile screens. Color consistency throughout the application improves the overall user experience and strengthens the visual identity of the app.
- **Typography:** Readable and modern typography was used to maintain clarity and consistency across all screens. Different font sizes and font weights were applied to create a proper visual hierarchy between headings, subheadings, buttons, and content sections. The typography improves readability and helps users quickly identify important travel information.

- **Tools Used:** Figma

- **Main Features:** The following are the main features included in the application:

i. Splash & Onboarding: The splash screen introduces the application branding, while onboarding screens help users understand the application before entering the home page.

ii. Home Screen: The home screen allows users to search for flights quickly using destination, date, and passenger details. Popular destinations are also displayed for easier selection.

iii. Flight Booking: Users can view available flights, compare prices, and select suitable options according to their budget and travel schedule.

iv. Passenger & Seat Selection: The application includes passenger detail forms and a seat selection interface to improve customization and convenience.

v. Hotel & Offers: Users can explore hotels and view discount offers to enhance travel planning and save money during booking.

vi. Booking Summary & Payment: A booking summary screen provides fare details, taxes, and the total cost before payment. Multiple payment methods are included for flexibility and convenience.

vii. Confirmation & Profile: After successful payment, the booking confirmation screen appears. Users can also manage their personal information and bookings through the profile section.

- **Prototype Interaction:** Interactive navigation was created using Figma Prototype Mode. Buttons, navigation bars, and clickable components were connected across screens to simulate a real mobile application experience. The prototype follows a complete user journey from onboarding to booking confirmation, ensuring smooth screen transitions and easy navigation.

- **Prototype Flow**

Flight Search

- **Conclusion:** This project successfully demonstrates a complete travel booking mobile application prototype with modern UI design, smooth navigation, and an intuitive user experience. The prototype fulfills the requirements of the CodeAlpha Mini Project Task by presenting a realistic and fully interactive travel booking application experience. The project also helped improve practical skills in UI/UX design, prototyping, layout structuring, color selection, and user-centered design principles. Future improvements may include real-time ticket integration, dark mode support, and personalized travel recommendations.
